

VPN client for Symbian

NCP offers VPN solution for Symbian OS-based mobile devices

NUREMBERG, March 12, 2008 – NCP engineering GmbH provides users of Symbian OS-based mobile devices with secure access to the company network. The new IPSec client can be used, for example, on mobile devices such as the Nokia E-Series which run Symbian OS from V.9.0 on S60 3rd Edition. This again underlines NCP's claim to offer security and state-of-the-art communications solutions for general data communication.

The functional scope of the software is based on that of the established Secure CE clients for the Windows mobile and Windows CE operating systems. Among other things, it has an assistant for the configuration PC, an intuitive graphical user interface on the mobile end device, and an integrated dynamic personal firewall. Other functions include automatic and secure set-up of the VPN configuration on the mobile end device via the mobile phone network, as well as support for authentication methods such as One-Time Password.

Like all NCP VPN clients, Secure Enterprise Client for Symbian can communicate with VPN gateways from different manufacturers, and is ideal for use in remote access VPN environments. This Client offers Endpoint Policy Enforcement for monitoring the centrally specified security policy. The software is available at the end of June. An NCP Secure Entry Symbian Client follows in July/August.

You want to see the NCP solutions live? Go to the RSA Conference in San Francisco, Booth 1332, 7. – 11. April, to the Information Security Europe in London, Booth H201, 22. – 24. April or to CeBIT Australia, Sydney, 20. -22. May.

IDs: 1.519

Availability and sources

A 30-day trial version of the Client offering unrestricted use is available in April on the Internet at: <http://www.ncp.de/index.php?id=187&L=1> . The software is available via the NCP e-store and from NCP sales partners.

About NCP

NCP engineering GmbH headquartered in Nürnberg Germany is a provider of application and industry-neutral communication software for highly secure data transmission in public networks and the Internet. Core competencies are in the areas of IP routing, central management of remote systems, as well as encryption, VPN, and firewall technologies. Under the guiding principle of "Secure Communications" the firm develops products and solutions for the areas of mobile computing, teleworking, E-commerce,

online banking, production data acquisition, system control (remote maintenance), and branch office networking. NCP product technology guarantees integration and

compatibility with products from other manufacturers. NCP relies on collaboration with technology partners and OEM partners, and on sales via distributors and certified system houses for national and international marketing. Customers include companies, government agencies, and organizations.
